Category:		Estimated time:	0.00 hour
Target version:		Spent time:	0.00 hour
Description			
If a process is killed by the stdout(except? don't know if it makes sense here) observer it would be nice to have a delay time.			
E.g. if the debug out msg is "done with the ball tracking process, now I'm going to copy stuff to \$dir" one could implement a "if \$str appears, wait for 20s and then kill the process" function
