- Category set to project described by recipe

Seems to be a bug in the project. The CMakeLists.txt file contains the following line:

find_package(Boost \${Boost_USE_VERSION} REQUIRED thread system filesystem)

but Boost_USE_VERSION doesn't seem to be defined anywhere (as the generator remarks).

Compare to e.g. RSC which has the above line, but also:

SET(Boost_USE_VERSION 1.38 CACHE INTERNAL "Boost Version to use")

#2 - 2016-03-11 14:54 - Johannes Wienke

This is a corner case, I would say. Despite having an undefined variable, the call, with the variable resolving to blank, is still valid. In theory this could be used to optionally let the user provide a version via the command line (ignoring the cache).

Sure. In this particular case however, I suspect that the `find_package` call has been copied from RSC without also copying the `set` call.

Also, the generator will still note the dependency, but without a version.

#4 - 2016-03-11 15:01 - Michael Goerlich

both of you are right. I just got the impression, that jobs are not being updated (which was the result of a forgotten push actually). Maybe the word "warning" or "information" instead of "error" would be less misleading?
